

Product Manual

Photos are for reference only kind prevail

Chapter 1 Introduction

This bicycle is designed with 3D technology, with a beautiful model. It is fashionable and casual, and is of a unique style. Its structure is very simple but not common, and noble but not arrogant.

You will love it at the first sight! Its main features follow:

1. Lithium cell: The product has passed all the tests required by CE, ROHS and UN3803 Certification Standards, it is very safe and reliable. Its service life is 3 times longer than that of lead-acid cells, so replacement is almost not needed- overlong service life. Its weight is 1/3 of that of lead-acid cells, very light. The voltage is sufficiently high for climbing and rapid speeding-up- high energy. It is a kind of recognized green power, and hence there will be no pollution occurred during the whole production and usage.
2. Cell bin: It is hid at the central plane underneath the pedal, so it is loaded evenly, compact, convenient and safe.
3. Motor: It is made of high-quality magnetic steel and silicon steel sheet, with thick coils, a precise bearing and a thick motor shaft. Thus, it has strong power and capacity and is durable.
4. Tyres: Tyres adopted are over-wide straight-grain vacuum tyres used by ATV. Such tyres are thick and firm, with better stability, stronger holding capacity and super-short braking distance. And what's more, you do not have to worry about tyre burst. They will bring you a safe, comfortable and smooth cycling.
5. Bicycle frame: from three-dimensional virtual design and assembling to technology_ advanced numerical control pipe bending and argon arc welding, all these operations are accomplished without stopping. Super-large pedals will bring you safe and free cycling, Whether you stand or sit down, and will also bring you worry_saving loading experience.
6. Disc brake: a compact and fine oil disc brake is adopted. The pump body adopted Aluminum alloy forging technology and advanced CNC processing technic makes the whole bicycle brake flexibly and freely
7. Handlebar: it is of stream line ergonomic leisure design, and is very firm, so will make you handle freely.
8. Turning bar: injection molding by soft rubber materials mould is adopted for it, so it will bring you comfortable holding.
9. Cushion: it adopts brand new plastic plate, highly flexible foam and high-level anti-slip leather, with well-designed exterior, perfect manufacturing and suitable saddle height, which will make you ride comfortably, even for a long time.
10. Intelligent charger: it is of full-automatic and portable design. When charging, no care is needed. Wherever there is 100-220V AC power supply, charging can be done.
11. Controller: it has been calibrated specifically and starts up flexibly without pause, which make cycling more safe.

Chapter 2 Parts name and overall view of the whole bicycle

(Zoom in picture)

Chapter 3 Main technical parameters

1. Main technical parameters of the whole bicycle

1. Overall dimension: 1750*750*770mm
2. Wheel base: 1300mm
3. Seat height: 700mm
4. Weight of the whole bicycle: $\leq 60\text{kg}$
5. Tyre specification: 18*9.5-8
6. Max. load: 150kg
7. Designed max. speed: $\leq 45\text{km/h}$
8. Continuous cycling mileage: 45~65km
9. Max. torque: 95n/m
10. Max. slope: $\leq 18^\circ$
11. Braking performance (speed 20KM/H): dry condition: $\leq 1.2\text{m}$; wet condition: $\leq 3.1\text{m}$

2. Main technical parameters of the storage cell

1. Cell type: power lithium cell
2. Capacity: 12Ah □ 15Ah □ 20Ah □ 25Ah

3. Nominal voltage: □ 60V □ 72V

3. Main technical parameters of the motor

1. Motor type: brushless direct current hub motor
2. Rated power: □ 500W □ 800W □ 1000W

4. Main technical parameters of the controller

1. Current-limiting protection value: $\leq 25: \pm 1\text{A}$
2. Under-voltage protection value: $52 \pm 0.5\text{V}$

5. Main technical parameters of the charger

1. Input voltage(AC):AC140~240V50/60Hz
2. Output voltage(DC): $71.4 \pm 0.4V$
3. Charging time(depending the remaining electricity): 5~7h

Note: when above parameters are changed, we will not give further notice. See our technical parameters database for parameters of a specific bicycle!

Chapter 4 Operation method and considerations

1.Considerations for safe driving

1. Please observe traffic regulations and drive it safely. Please control the speed within safe speed range (note: safe speed of this bicycle is within 200km/h).
2. Before driving: get familiar with this instruction first, and then perform exercise at an open site. Make sure that you fully master driving skills and get familiar with the structure and performance of this bicycle, which are the foundation for safe driving.
- 3, Do not lend it to those personnel who are not familiar with or unable to drive it or ask them to drive it. It is dangerous to drive it by one hand or even without hands or drive it when intoxicated.
4. Take more care when driving it in raining or snowy days: danger may occur due to wet ground in raining or snowy days! Thus, you should drive it slow speed and take more care when turning. You must particularly remember that you do have to brake in advance in raining or snowy days to prevent accidents!!!
5. Wear a helmet correctly: wear a helmet correctly and tighten the belt when driving.
6. Wear suitable clothing: do not wear tights so that your whole body can move freely. You should wear clothing with sleeves unopened and low-heel shoes as practicable as possible.

Note: in order to ease maintenance, repair and service, each bicycle produced by our company is marked with a bicycle frame number and motor number, so as to assist distribution until to provide better service for you. The bicycle number is engraved on the seal plate, and the motor number is engraved on the outer housing cover of the motor.

7.Do not overload: the max. load of this bicycle is 100kg, The handing feeling of handlebar with load is different from that without load. When many articles are loaded, holding handlebar will vibrate, resulting in danger. The stable load of this bicycle is one person, it will be very dangerous to load articles or person at the front pedal.

2. Method for correct operation

1. Driving method

- ①Keep the natural posture, and free driving can be got.
- ②Driving in sitting posture: please always keep your body at the center of the cushion to prevent load reduction of the front tyre and danger caused by handlebar vibration.
- ③Driving in standing posture: when speeding up, you should turn the turning handle slowly. Danger caused by instability due to sudden speeding-up should be avoided.
- ④Drive it slowly on roads with surface damaged or that paved with gravels.

In raining or snowy days, wet ground will easily cause side slip, so you should drive it slowly with much attention. When the water accumulated on roads becomes above the cell box located underneath the pedal, do not drive it, so as to prevent electrical parts damage caused by short circuit. Meanwhile, braking performance will decrease, which will cause accidents easily.

2. Parking method

① When parking, please pay attention to those vehicles and pedestrians around. Park it to the right side of flat road slowly, do not park it on a slope.

After parking it stably, turn the power supply lock rightwards to pull it out and take it down, and then lock the bicycle with a lock.

3. Operation method for electricity indication

After the power supply lock is connected, the voltage indicator light will be turned on. At full charge of capacity, there are green, yellow and red light, with 5 grids in total. The green light has three grids, with each grid of 25% of rated electricity; each grid of the yellow light is 20% of rated electricity; while each grid of the red light is 5% of rated electricity. The yellow light going out while the red light going on indicates that there is no electricity left, so when you find that the blue light goes out, you should charge the bicycle immediately.

4. Operation method for power supply lock:

After the key of the power supply lock is turned by a shift in clockwise direction for connection, the motor can be started up. During driving, you do not remove the key and switch off power supply, nor can you turn the key in counterclockwise direction to close the power supply local. Once you switch off the power supply, the motor will stop running. After parking, you should turn the power supply lock in counterclockwise direction to switch off the power supply and then pull the key out.

5. Turning handle (speed-governing handle)

If the turning handle is turned towards the driver, the bicycle will be speeded up; and if it is released to turn back, the speed will be reduced. After reset, cut off the power supply of motor.

6. Operation method of disc brake and considerations

(1) Operation method of disc brake

① Brake clearance adjustment: turn the adjusting screw which is located between the braking handle and the handlebar tube using a 2mm Allen wrench, adjust the clearance between braking pads and the braking disc until your hand feeling is comfortable.

② Replace the braking pad when braking pads are worn off by more than 1mm or the adjusting screw of braking pads are adjusted to the end position or every half a year. When replacing braking pads, press in one of braking pads using a clean slotted screwdriver to vacate space for taking out the other braking pad. After replacement is complete, it is needed to return the adjusting screw of braking pads to a suitable position (a position that makes your hand feeling comfortable).

③ Run-in period: the run-in of disc brake surface needs a certain time. After complete run-in, braking force will increase significantly. The first week in which you use a new disc brake is the run-in period.

During run-in period, do not brake with too great force, otherwise un-recoverable damage will be caused to braking pads and braking body. The correct operation method is to brake slightly during driving, so that there is appropriate friction kept between braking pads and the disc brake.

④Oil replacement: this disc brake adopts mineral oil, which should be replaced (2~3 years in general)

When the braking handle is felt weak. Replace oil using an injector.

(2) Considerations

①Do not use lubricating oil around the disc brake and braking pads, as well as the calliper. Do not touch the surface of disc brake and braking pads with hands, otherwise braking performance will be reduced significantly.

②You'd better not shower a new brake to prevent a small quantity of lubrication grease in assembling clearance from contaminating braking pads.

③Oil hydraulic disc brake has strong braking force, you need to do much exercise at a safe place, so as to adapt to the difference from a common brake to avoid braking with too great force, resulting in injury due to wheel lockup.

7. Operation method of the charger and considerations

(1) Operation method

①When charging, plug in the plug of cell box first, then that of electric supply AC220V. When charging is complete, take the counter procedures, that is, unplug the plug of electric supply AC220V, then that of cell box.

②During normal charging, the indicator light of the charger shows red. When fully charged, it will show green;

③If Charging ambient temperature is too high, the red light will flash, which indicates that the charger is in the temperature protection state. Please take the charger to a cool or well-ventilated place. When the inside temperature of the charge lowers to 60°C, normal charging occurs.

④If there is no cell connected during usage, what the charger output is a pulse voltage less than 42V.

When testing, Place a 1KΩ ohmic load between the positive and negative output terminal, then actual charging voltage of the charge can be obtained.

(2) Considerations

①The charger can only be used indoors,

②Charging in a closed space or under scorching sun or at a high temperature environment is strictly prohibited. Do not put the charger on a seat cask or inside the rear compartment for charging

③In Case of no charging, do not connect the charger to an AC power supply without load for a long time.

④During charging, if the indicator light is abnormal, there is abnormal smell or the housing of the charger is too hot, please stop charging immediately, and repair or replace the charger.

⑤Do not disassemble or replace the devices inside the charger by yourself.

- ⑥ Do not charge the charger that has been fully charged.
 - ⑦ Do not use the charger in an environment with flammable gas, otherwise explosion or fire will be caused.
 - ⑧ Do not place the charger near water source or wet it, otherwise fire or electric shock may occur.
 - ⑨ In the event that inside parts are exposed due to charger damage caused by collision etc. Don't touch them with hands, otherwise you may be injured due to electric shock
- ## 8. Operation method of the cell and considerations

(1) Charging

- ① Make Sure to charge using the charger specifically equipped by our company. Irregular or non-confirming chargers may reduce life of the cell or invalidate the cell.
- ② The cell that has been fully discharged (the bicycle stop running) can be charged with more than 95% of electricity within 5h, and can be fully charged within 8h.
- ③ During charging neither the positive end nor the negative end is allowed to be contacted with metal.
- ④ When leaving factory, the cell's electricity is about 80%. Prior to driving a new bicycle, charge it for 3~10h.
- ⑤ If the bicycle is left for more than one month, cell's electricity will reduce by about 15%. It is recommended to charge it before use.
- ⑥ Please charge the cell timely to ensure driving mileage.
- ⑦ During charging, the charger may become hot. As long as the temperature does not exceed 60°C, it is normal.
- ⑧ When charging, please put the charger and the whole bicycle at a stable and dry place which is free of flammable and explosive goods and is out of reach of children.
- ⑨ You should charge the cell within 24h after it is fully discharged, and charging time should not be less than 3h.
- ⑩ Make sure that there is no short-circuit at the charging port.

(2) Discharging(use)

- ① Do not use the cell for purposes other than the electrical bicycle of this model, otherwise warranty will not be provided.
- ② Once short-circuit occurs, the cell management system will provide automatic protection, and the fuse piece connected in series with power line will fuse, giving dual protection for you cell. At about 2min after the short circuit is released and the fuse piece is replaced, the cell will work normally.
- ③ Damage or unreasonable configuration of the controller, motor, horn, lighting facility, etc. of electrical bicycle all will cause the cell to discharge at high current. At this time, the cell will stop output for protection, but will recover within 10s, which will not have any effect on your driving.
- ④ Working temperature range of the cell: -10°C~55°C. Like other cells, its available energy will reduce with the rise of temperature, which is a normal phenomenon.
- ⑤ Make short out the discharging port

(3) Storage

- ① If long-time storage (more than one month) is needed, it is recommended to charge the cell to 60%~80% of electricity. During storage, it is needed to charge the cell

every 3 months, and charging is also needed before usage.

②The cell should be stored at a cool and dry environment.

3. Check, cleaning and maintenance

(1) Regular or daily check

1. Check the whole bicycle at a safe place.
2. Check whether the abnormal part found the day before impacted running.
3. Braking effect of the brake: check whether the braking handle can be holding and pinching gently and whether the clearance is appropriate. Check whether it can brake bicycle normally.
4. Check whether there are chaps, damage or abnormal wear on tyres or whether there are such sharp objects as metal, pebble, glass embed in tyres. If the lug on a tyre has been worn off by 2/3, replace the tyre, Check tyres' air pressure according to sunken condition of the part of tyres contacted with ground. The normal air pressure of front and rear tyre is 1.5kg/cm².
5. Check whether the power supply's voltage indicator indicates full capacity(according to Point3 of item2 under Chapter 4).
6. Steering system: swing the handle and front fork upwards, downwards, forwards, backwards, leftwards and rightwards to check whether tightness is suitable and steering is flexible, and whether there are such problems as abnormal sound caused by collision, steering system loosening, collision sound. If there are, please contact the distributor, so as to provide perfect after-sale service for you.
7. Check whether the front and rear wheel shaft become loose.

4. Common fault and remove method

Number	Fault	Causes	Removal method
1	Speed-governing fault or max. speed decreased	①Too low cell voltage; ②Speed-governing turning handle damaged; ③The spring inside speed-governing turning handle got stuck or failure	① Charge the cell; ② Ask the distributor for replacement; ③Ask the distributor for replacement;
2	The motor does not work after power supply is switched on.	① The cell's connecting line becomes loose; ② Speed-governing turning handle damaged; ③ Motor's output line becomes loose or damaged	① Reconnect it; ② Ask the distributor for replacement; ③ Ask a dedicated maintenance station to repair it;
3	Continuous driving mileage is not sufficient after charging.	①Air pressure of tyres is too low; ②low power or the charger failed; ③Aging of the cell or it damaged; ④Much climbing, great headwind, frequent braking and starting, heavy load;	① Fill enough air; ② Fully charge the cell or replace the charger; ③ Replace the cell; ④ Such condition will be improved when driving condition changes.
4	The charger fails to charge.	①The socket of the charger falls off or the connection between plug and socket becomes loose; ②The fuse inside the cell box fused; ③Battery pack's connecting wire falls off;	① Fasten the socket or connectors; ② Replace the fuse inside cell box; ③ Weld connecting wires.
5	Other fault	①If there is a fault that you cannot determine; ②If the inside of the motor, cell, controller, charger, etc. damaged.	Please ask the distributor or dedicated maintenance for repair, do not open these parts by yourself. Otherwise, warranty will not be provided.

Chapter 5 Quality assurance and after-sale service

According to the Law of the PRC on the Protection of the Rights and Interests of Consumers, in reference to spirit of relevant documents of the State Administration of Quality and Technology supervision, in order to practically protect consumers' legal rights and interests, perfect the civil responsibility system about product quality and perform "three guarantees" (repair, replacement and return) obligation and responsibility, you can enjoy "three guarantees" service from the maintenance & service station designated by the bicycle-selling unit by virtue of the warranty card, and specific provisions are as follows:

1. "Three guarantees" range

1. When you purchase a bicycle, you should check it on site, and have the right to require the sale personnel to provide operative instrument and warranty card, as well as address and phone number of the maintenance unit.
2. After purchasing a bicycle, you should carefully read the Operation Instructions, and master correct operation method and the considerations for daily maintenance. If you are to lend your electrical bicycle to a person who is not familiar with operation method, you should offer him explanation to prevent accidental damage.
3. If performance fault occurs within 7 days after sale date, you may choose to replace or repair it, provided that you use it correctly according to the Product Instructions.
4. If during the three guarantees, effective period, a bicycle is repaired many times, but isn't repaired well so that it cannot be operated normally, you may exchange it for one of the same model by virtue of repair records and certificates that are provided by the maintenance unit and identified and confirmed by our company's general after-sale service department. As for a bicycle which will be exchanged for one of the same model, depreciation expense (2.7% for the whole bicycle every day) will be charged as per regulations. The cell that has been used will not be exchanged.

2 Range and content beyond "three guarantees"

1. The fault caused by failure to use, maintenance or adjustment, by the user according to the Operation Instructions.
2. The fault against which technical evaluation and analysis cannot be done because fault's original slate is destroyed due to refit, disassembly, repair and dismantling by the user himself.
3. Accessories other than that provided by "fly" are used,
4. The fault caused by improper use or maintenance by the user or by accidents;
5. The bicycle without warranty card or the bicycle that is not corresponding to the warranty card;
6. "Three guarantees" service will not be provided for easily-damaged parts and consumer goods;
7. The secondary fault caused by continuous use by the user after a fault occurrence.
8. The bicycle without certificate;

9. Unilateral amendment of invoice date or the part No. on bicycle.

4. Warranty principle

For the fault beyond "three guarantees" range and main accessories used after three guarantees period expired, our company will still provide maintenance, but a fee will be Charged.

Electrical bicycle sale (warranty) registration card

NO:

Name of user		Purchase date	
Country/Post code		Tel	
Model		Bicycle color	
Bicycle frame NO.		Motor No.	
Signed by the user			

Installation Steps

Open the outer packaging. All parts are shown in the picture, please check carefully

Front side steel pipe

Loosen the screws of the steel pipe

Put the loosened screw and the steel pipe together. Will be used later

Assemble front fender

Place the front fender in the middle of the frame, Screws for fixing the front mudguard, raise the front fender and place it in the position shown in the figure. Fix with screws. Tighten the screws on the other side. The front mudguard is fixed.

Assemble front tires:

Remove the brake before assembling

Install the tires in the order shown below with the person standing in front of the scooter as the direction, put the tire with the disc brake on the right, then first you need to install a shorter connecting part on the tire right, second to put the tire under the fender, then put the long and thin metal rod through the frame and tire.

On the left side of the tire, put the longer metal connector on the tire first, and then put the frame on the metal connector

Put on the outermost fixing nut and tighten it

Install the brake

Install the brake next to the brake disc and fix it with two screws

Assemble handle bar

Handle mounting screws and fixings, fix the handle on the pole with the fixing part, Secure with four screws , Adjust the direction of the handle and tighten the screws

Handle installation is complete

Install rearview mirror

Rotate the screw of the rearview mirror for direct installation

Rearview mirror installation is complete

Complete vehicle installation
